HandOff.

A receipt for the version you sent

Solana devnet MVP for student project handovers

The last-minute project edit

09:40 The group sends studio-report.pdf

09:55 One teammate replaces the exported file

10:10 The reviewer asks which version they received

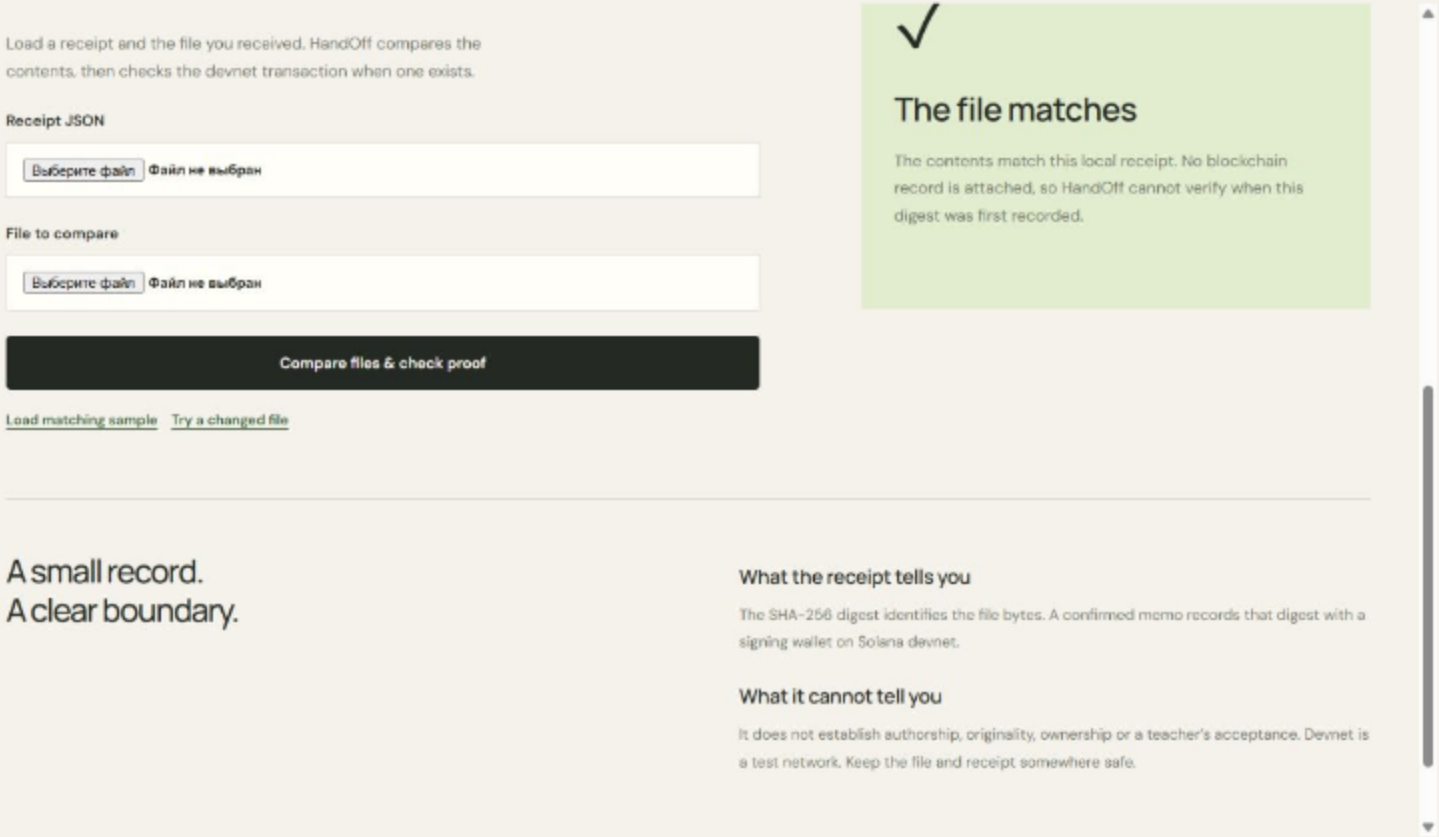

Illustrative scenario. User demand still needs validation.

A file match anyone can repeat

1 Choose the file

2 Share file + receipt

3 Compare the contents

A local receipt verifies a content match. It carries no trusted timestamp.

The Solana record

File bytes stay in the browser

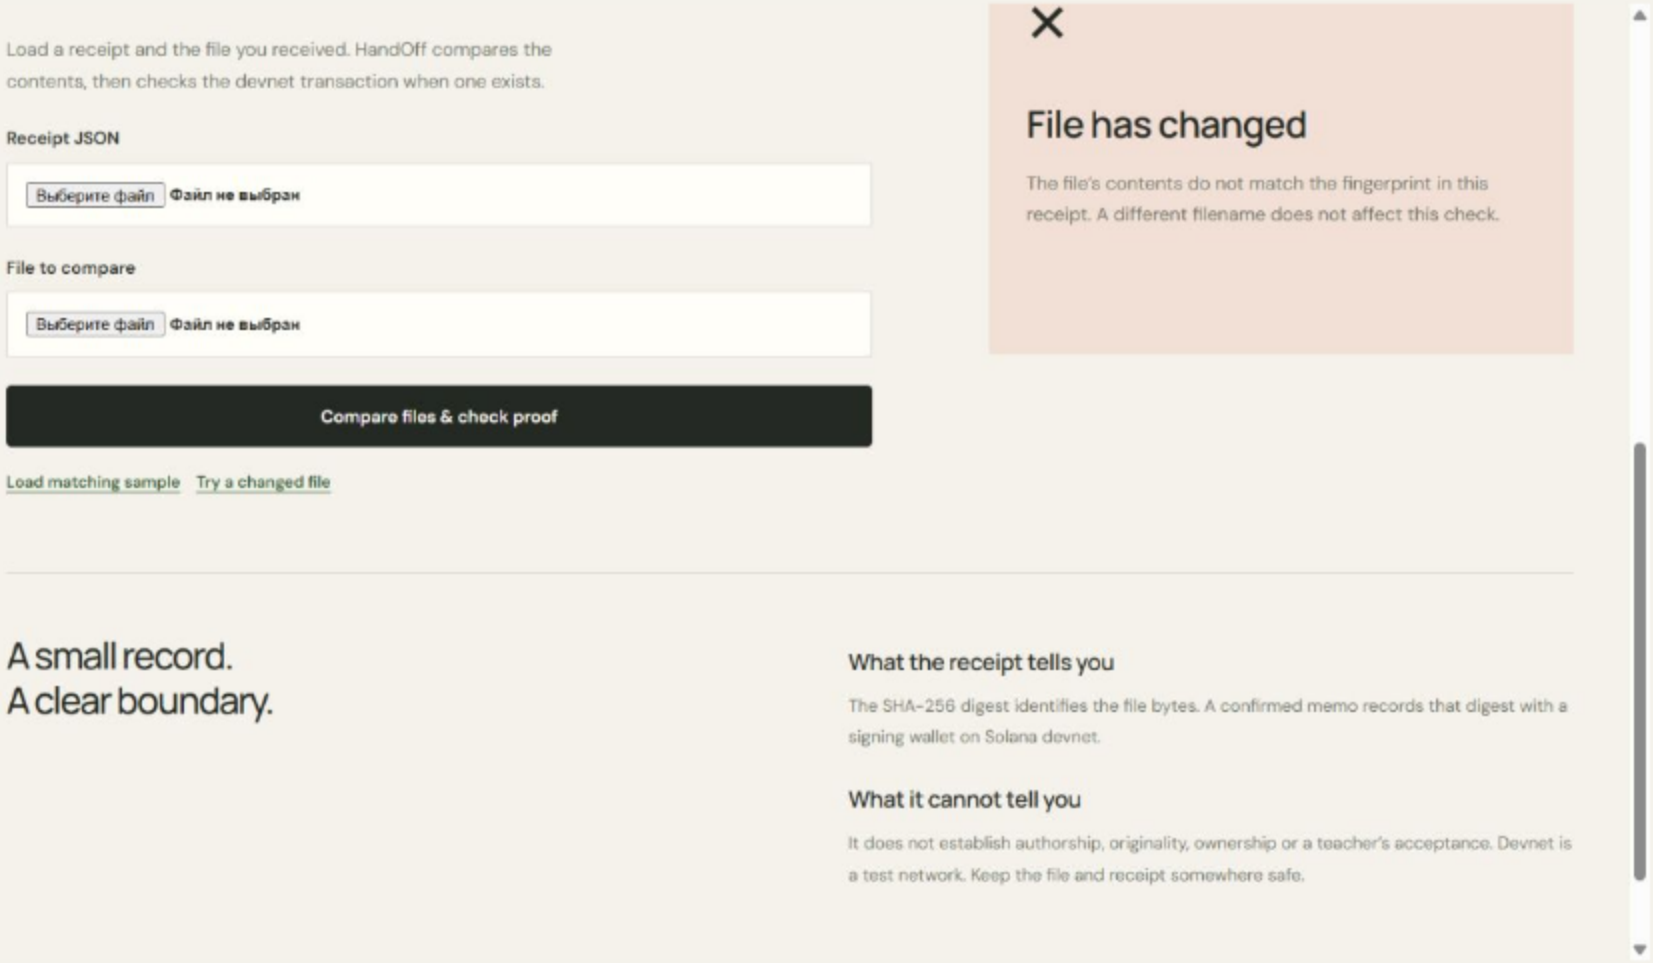

Public memo

handoff:v1:sha256:<digest>

The signing wallet approves the digest record.
The reviewer checks the transaction independently.

Devnet only. No token, escrow or custom contract.

The file changes. The result changes.

The comparison follows the bytes.

Renaming a file keeps its digest.

Editing the content changes it.

A focused first market

Student project groups

Free file receipts and independent verification.
No account required for the core workflow.

Course and project reviewers

Proposed paid cohort workspace with batch review and an exportable handover log.

Pilot proposal: 10 groups and 2 reviewers.
Measure completed handovers and independent verification.

MVP status and next test

Working locally

SHA-256 and portable receipts

Matching and changed-file checks

Devnet transaction integration

Before submission

Build or integrate in Noah AI

Run a real devnet wallet test

Publish the accessible project

Tested: 4 automated groups and the browser sample workflow.

The useful boundary

A checkable file handover

A receipt identifies matching contents.
A confirmed memo adds a public wallet record.

Authorship, ownership and acceptance remain separate questions.
Devnet is a test network. Keep the original file and receipt.
